

Data Analytics for BigFix Software Users

VISIBILITY ON OPERATIONS & SECURITY ANALYTICS

These types of Analytics from BigFix Data provide a summary of Security Posture and Operational Performance.

Critical Reports such as exposed number of assets, teams workloads and vulnerability posture are rendered by continent, region, country, business unit or site location.

Rather than spending countless hours on analyzing spreadsheets, DERESO™ allows for management to monitor Operational processes, track patching efficiency in both real time and monthly trends, to implement continuous improvements to the target SLA.

The Resolute Analytical Dashboard for BigFix Software

OPERATIONAL DATA ANALYTICS

Content for Operational Data include over 100 analytical metrics and indicators viewed from one single console. It is analyzed from BigFix Data coming from BigFix Insights. This Analytical Dashboard saves countless hours of spreadsheet reports. It is easy to use, with pull down menus, hover and click through features.

This near-real time and month to month historical trends lets you see the performance patterns consistently happening over time allowing for improvements relating to patching strategies and policy improvement. Overall, it lets you reduce mean time to patch (MTTP) and improve service levels.

The Patching Key Performance Indicator (KPI) section includes over 25 out of the box analytical reports. Included are key metrics containing patch policy performance, Compliance Trends all relating to the number of critical devices or assets.

VULNERABILITY DATA

The Common Vulnerability Exposure (CVE) Dashboard provides a single place to quickly find, track and fix vulnerabilities.

The selecting of the CVE and "drill through" to the CVE Patch Nexus action plan allows for identification of patches required to fix the vulnerability lessen the critical CVE scenario.

This data provides for CVSS severity levels by number of machines and various needed patches in order to quickly remediate vulnerabilities.

DERESO™ Analytical Dashboard is a visual representation of Assets, Patches and Vulnerabilities that help tighten focus on critical assets, allowing for process and policy improvements to meet Compliance and Service Levels.
